

#1 Saying Hello

Constraints:

- Keep the input, string concatenation, and output separate
 - I have the input, concatenation, and outputs as separate blocks of code within the file, comments within indicate these blocks

Challenges:

- Write a new version of the program without using any variables
 - I used python dictionaries to store inputs instead of variables
- Write a version of the program that displays different greetings for different people
 - Added some simple logic that gives a formal salutation to names with 5 characters or more. Shorter names get a basic greeting
